

MAKING MAIZE STOVER SILAGE

AIM: TO SUPPORT FARMERS TO MAKE MAIZE STOVER SILAGE TO FEED TO CATTLE DURING THE DRY SEASON

Why make maize stover silage?

- ❖ Crop residues such as maize stover, sorghum straw and wheat straw can be used to make silage;
- ❖ Stover silage mainly helps with body maintenance;
- ❖ When making stover silage, you need to add:
 - **Water** for moisture,
 - A source of **sugar (Molasses or mealie meal)** to cause fermentation,
 - **Salt** for palatability (for taste).

PROCEDURE FOR MAIZE STOVER SILAGE WITH MOLASSES

- ✓ Finally, the drum is closed airtight with plastic sheet and soil is put on top of the plastic (*see photos on page 2*).

MAKING MAIZE STOVER SILAGE

Tips when making stover silage:

- ✓ Use a bucket which is at least 10 litres for mixing water, salt and molasses;
- ✓ Use a scale to weigh the stover;
- ✓ If using coarse salt, mix with a small amount of water and dissolve salt before adding to the molasses / water mix;
- ✓ Put at least 5 layers of stover / straw. Sprinkle each layer with about 1 litre of the molasses / water / salt mix.

Preparing the molasses/ salt/ water mixture.

Compacting the stovers.

Adding the molasses/ salt/ water mixture to a layer of stover.

Covering the drum with plastic to ensure make it 'airtight'.

- ✓ Can be used after 6 weeks (45 days).
- ✓ Only open the pit / drum when you are ready to feed the silage to your animals.
- ✓ When the drum is opened it should be used every day until finished.
- ✓ When feeding 5 kg of silage per day, the drum has enough silage for 6 days for one cow.
- ✓ Note, stover silage can also be made in a pit. Ask your EO for advice on how to do this.

The ZDTP is focused on supporting dairy farmers to improve their productivity, milk quality and linkages to urban markets.
